

## Introduction to the QScreen Theme Editor

After installing the software according to the "How to Install and Use Qscreen" manual, connect the computer and the screen using a data cable.

Click the "Edit Theme" button to make edits and modifications to the current system theme.

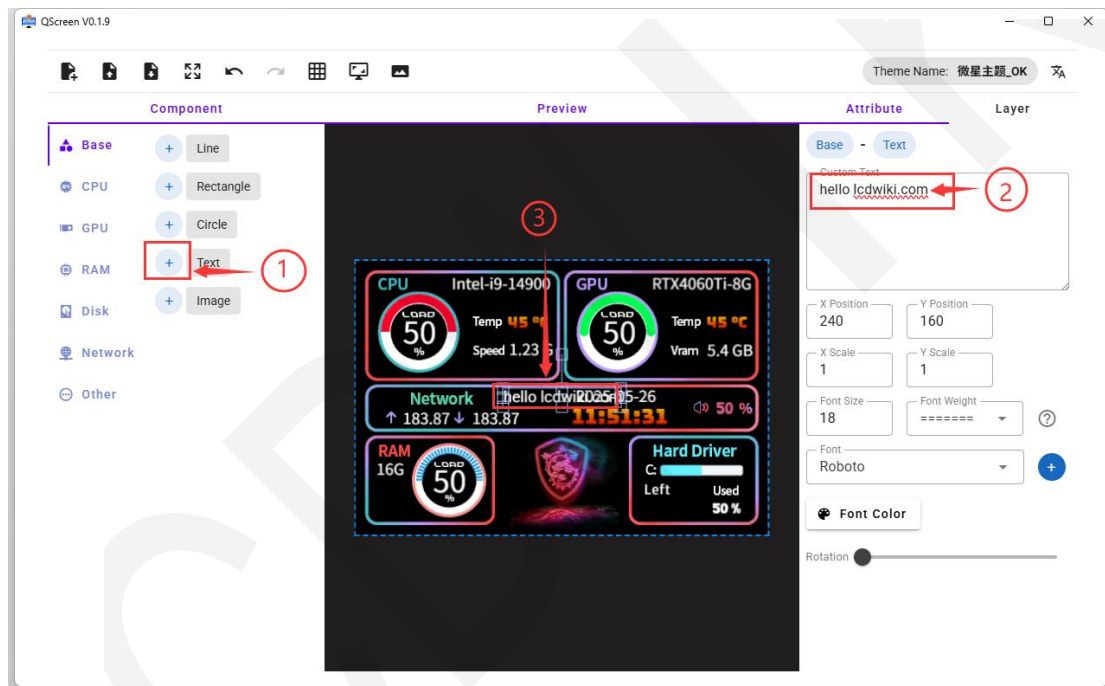

- ① Create a new blank topic
- ② Open the topic
- ③ Save the current modified theme
- ④ If the preview area position changes, click this button to reset it to the center.
- ⑤ Return to the previous step of the operation
- ⑥ Go back one step
- ⑦ Add grid for the current topic
- ⑧ Adjust the shape and size of the current theme screen
- ⑨ Select background image and color
- ⑩ Click on '+' and select different components to add to the background.
- ⑪ Preview the current modification topic and check the effect The current name of the modification topic
- ⑬ Select the display language of the page
- ⑭ After selecting any component in the preview image, click the "Properties" button to modify the properties of this component, such as changing the position and size
- ⑮ This will list all the components used in the current theme. You can also select components through this section. Clicking the 'X' on the right will delete the selected component

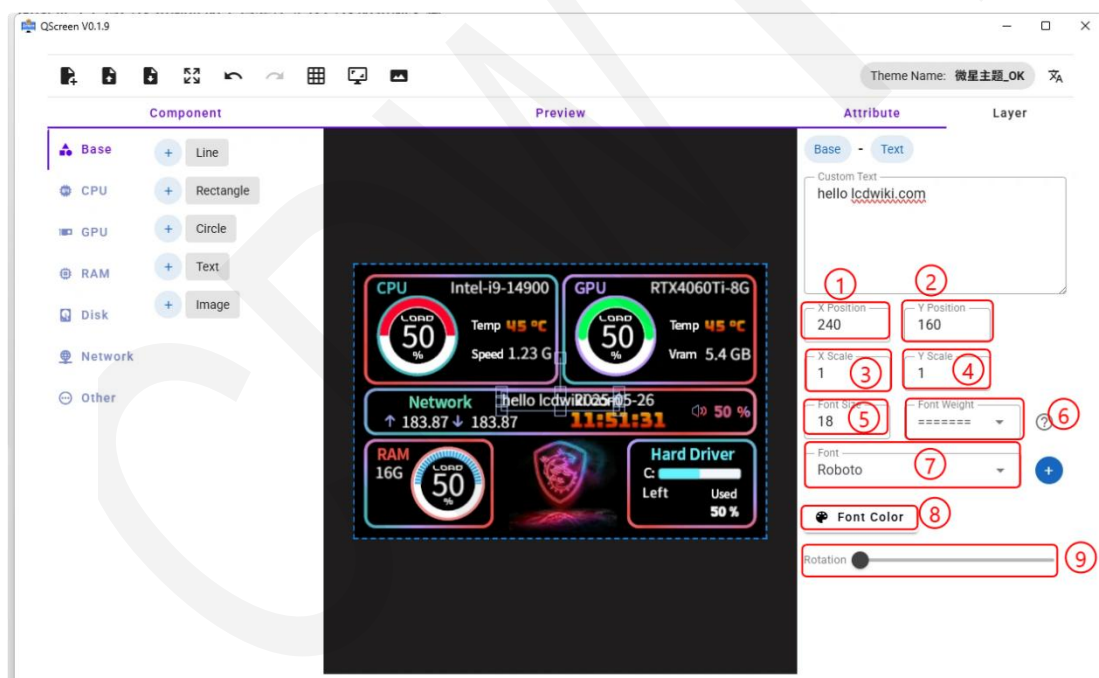

# Component Introduction

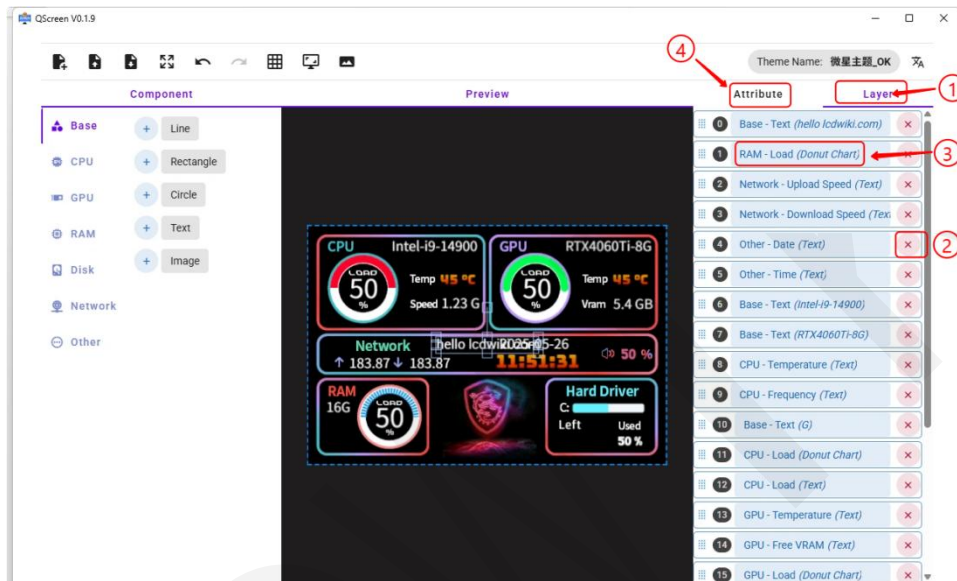

- ① Take the text component as an example of the basic component. By clicking the '+' sign on the left side of the component, a text component will be directly generated on the theme.
- ② The right part shows the attributes corresponding to the text components. We can modify the display mode of the text by setting these attributes.
- ③ The right part shows the attributes corresponding to the text component. We can modify the display mode of the text by setting these attributes. For example, if we input "hello lcdwiki.com" in the custom text box, the text on the corresponding topic will change.

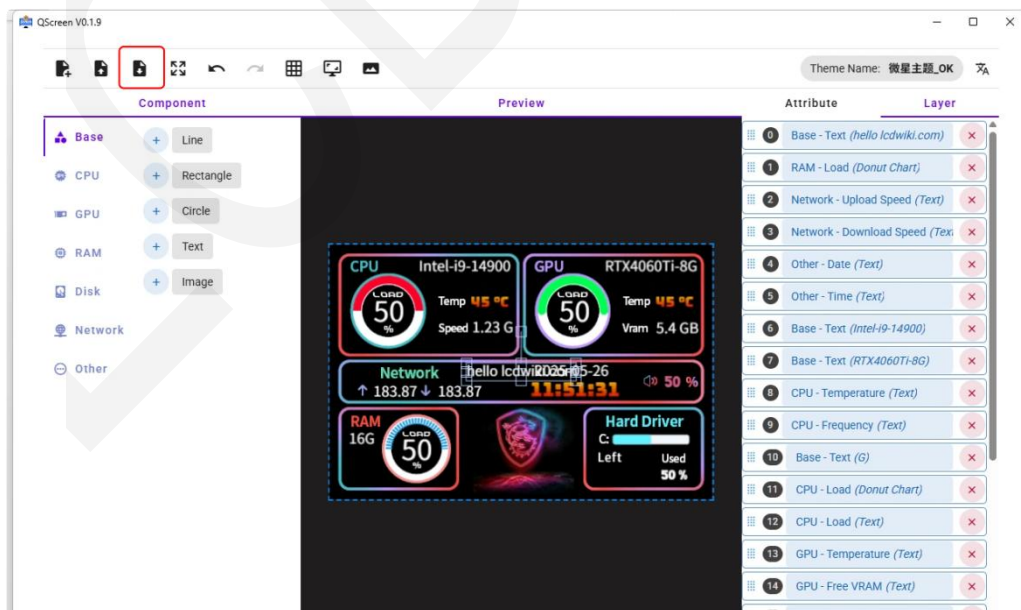

- ①通过修改 X 坐标 Y 坐标实现组件在主题上位置的偏移；
- ②设置 X 轴缩放或 Y 轴缩放对组件进行 X 方向或 Y 方向的拉伸实现对组件大小进行修改；
- ③④修改字体大小的值修改文本组件内的字体大小；
- ⑤⑥通过下拉字体粗细框的下拉箭头选择字体的粗细类型；
- ⑦通过下拉字体框的下拉箭头选择字体的类型；
- ⑧点击字体颜色对字体颜色进行修改；
- ⑨拉动旋转的滑动条对组件进行旋转；

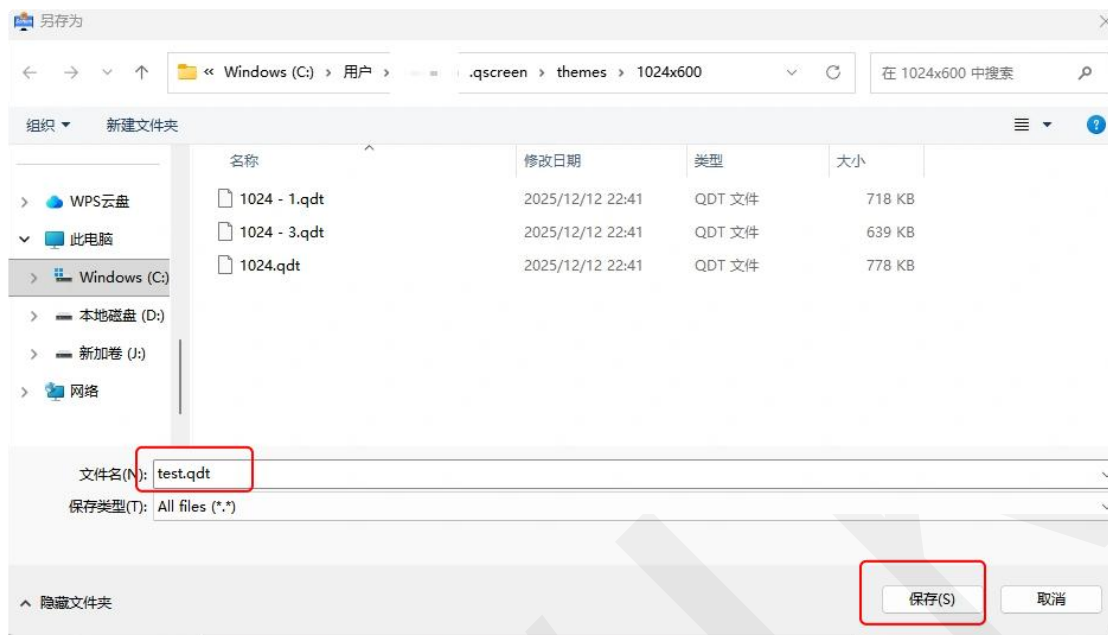

- ① Click on the layer on the right side of the properties to set the current theme's layer. All the components on the theme will be listed.
- ② Clicking the X on the right will delete the corresponding component.
- ③ Click on any component to select it. You can also select a component by simply clicking on it as it is set up.
- ④ Just go back to the properties page to set the properties of the selected component.

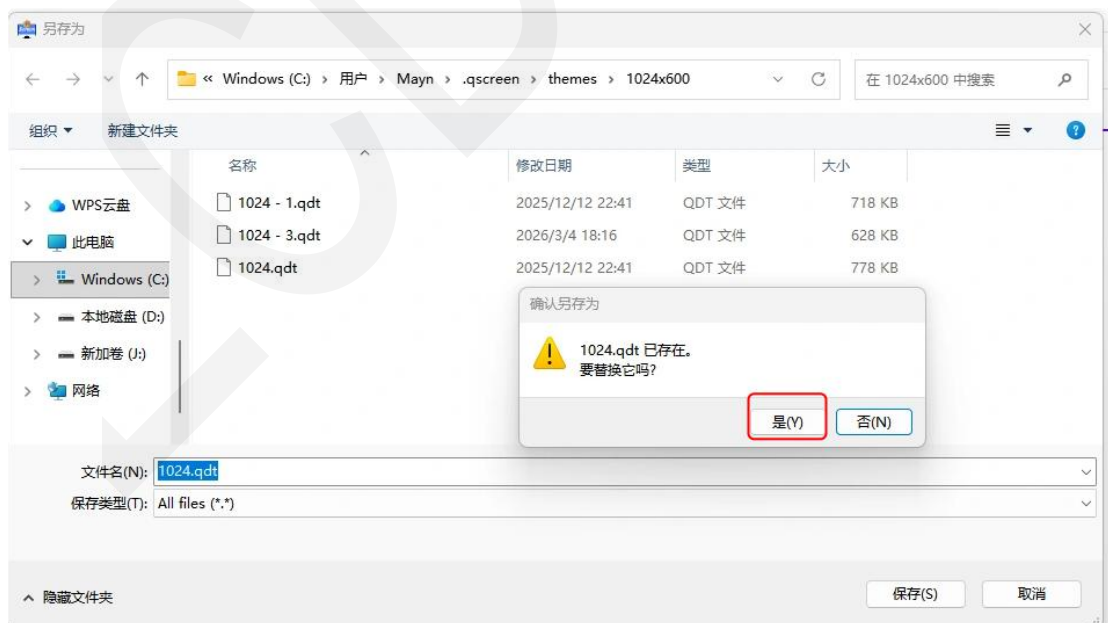

After making the changes, remember to press **Ctrl+S** to save or click the button at the top to save the modifications.

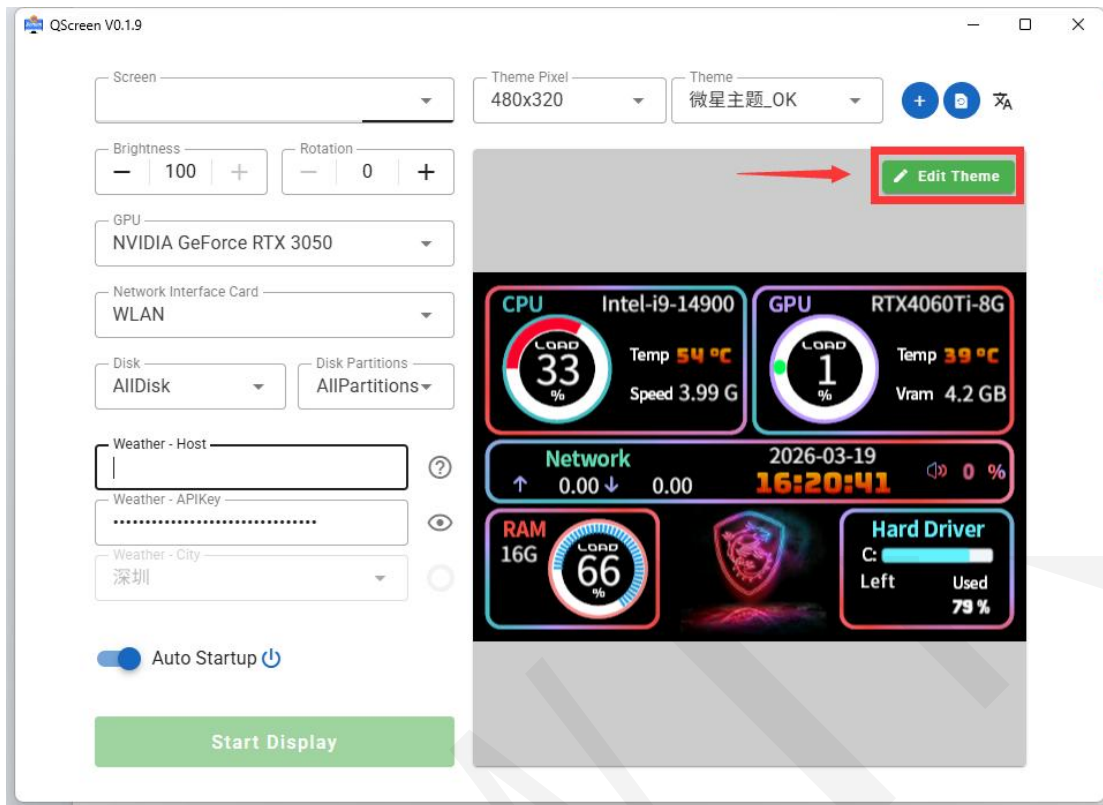

Remember the location where the file is saved. Usually, it is saved by default in the C drive. Name the file yourself and change the file extension to.qdt so that the system can recognize it.

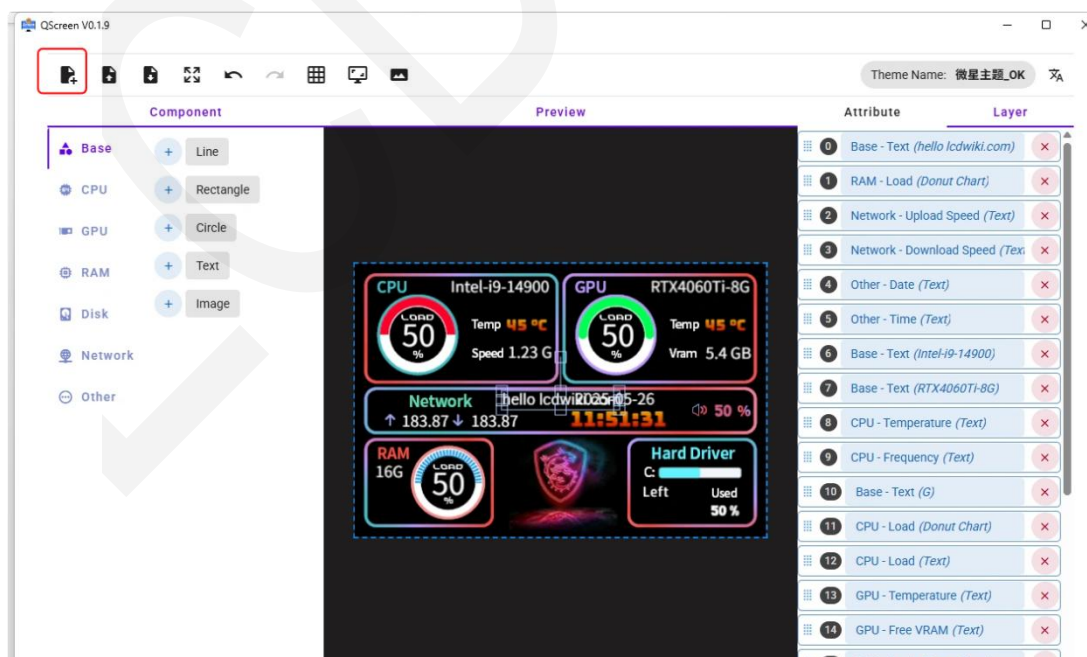

Because when saving the modified system theme directly, it will prompt whether to overwrite the original theme. Simply select "Yes" to overwrite the modification. After modifying the system theme, it won't take effect immediately. You need to close the software, restart it, or select another theme and then switch back to make it take effect.

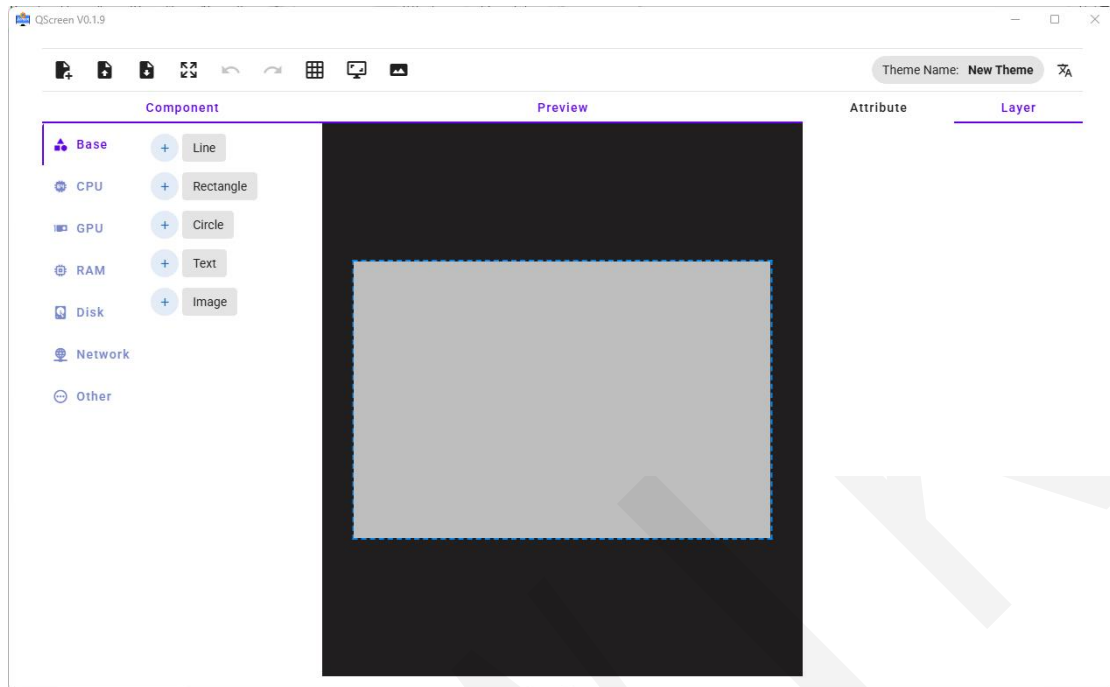

When you need to create a custom theme, go back to the software homepage, select any theme, and click on "Edit Theme".

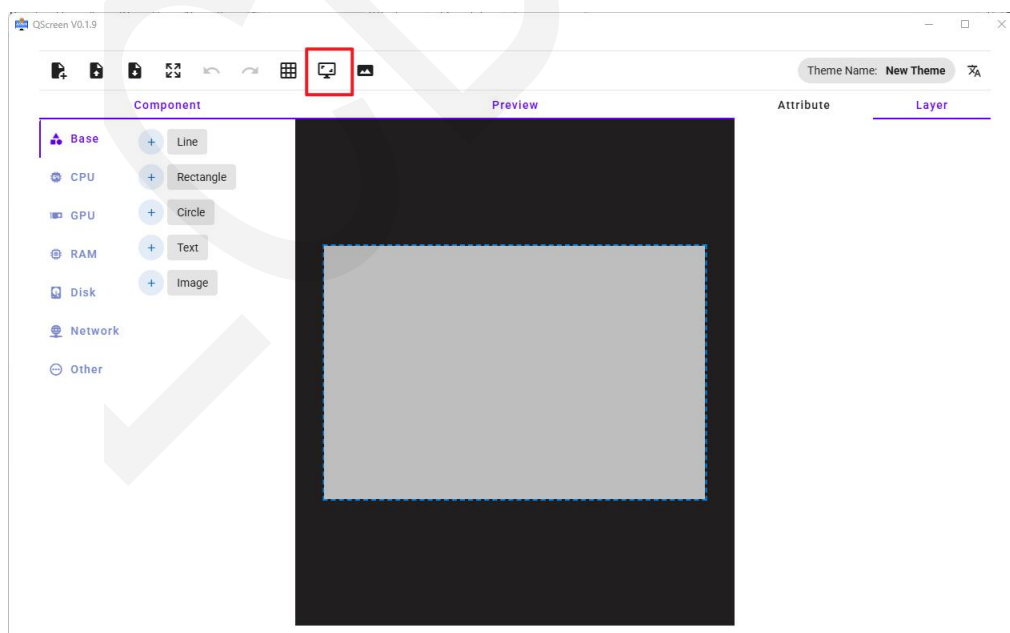

Click the "New Page" button on the top left corner.

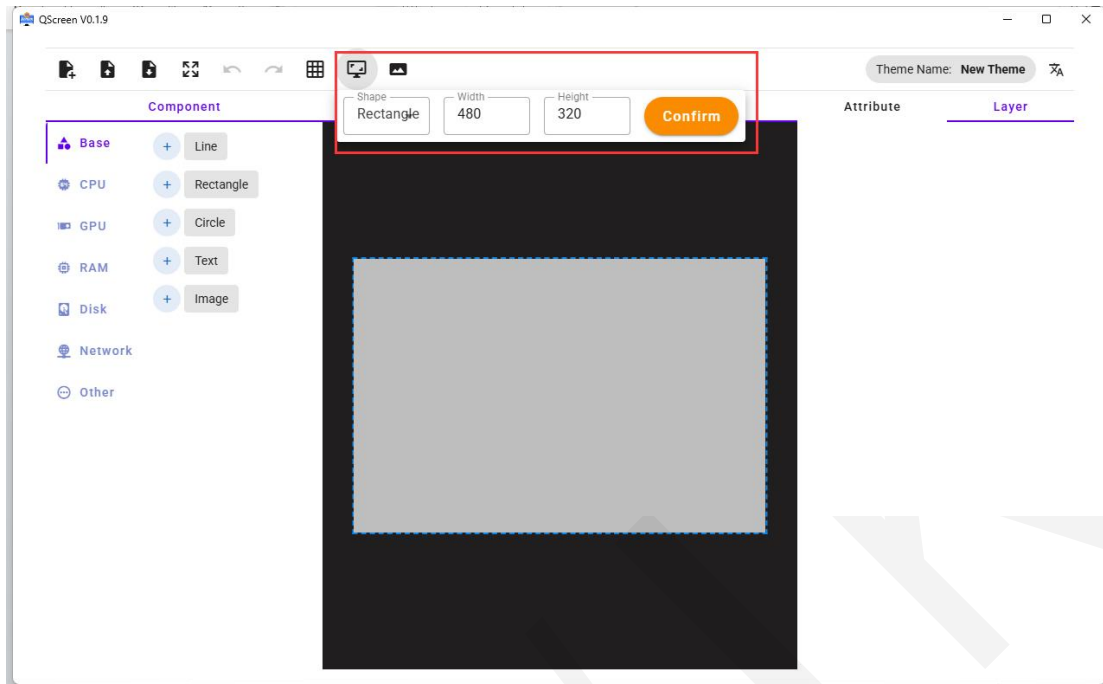

This will result in a blank topic. You can then edit it in the same way as editing system topics, and the operation will be exactly the same.

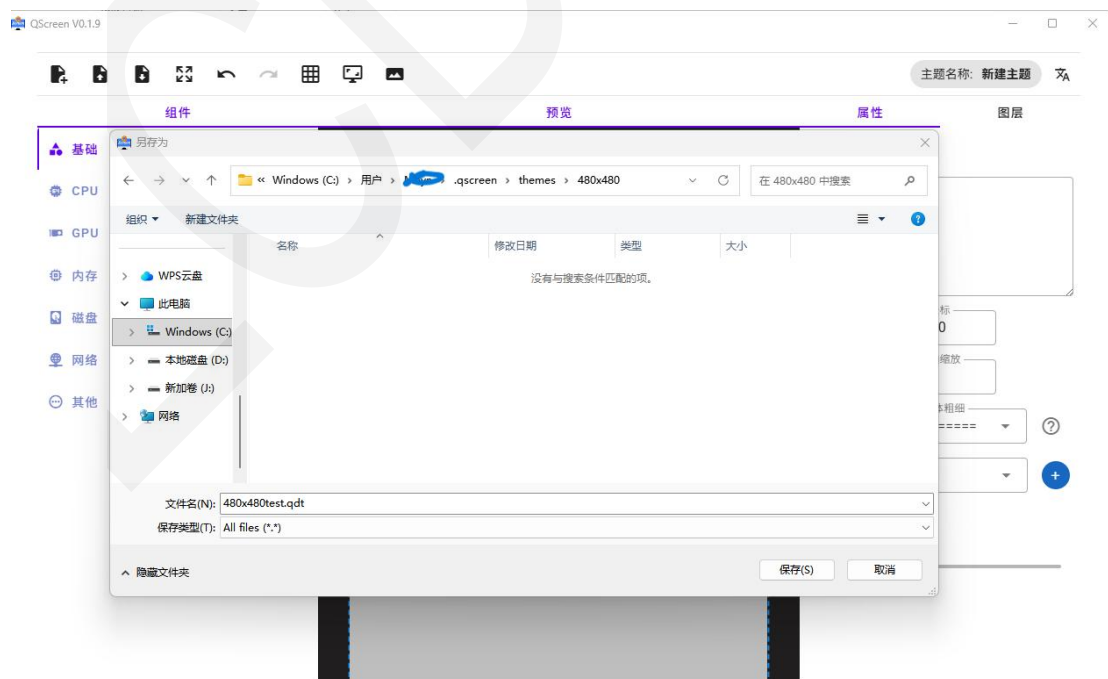

It is particularly important to note that clicking the button in the picture will set the screen size for the topic.

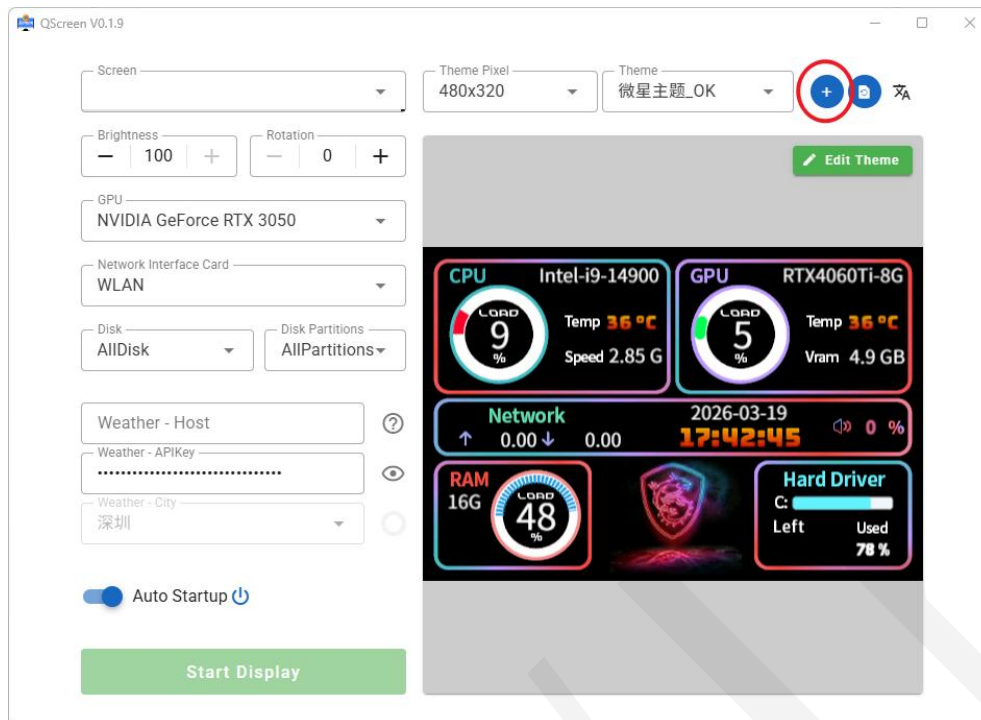

这里的选定的尺寸在后面进行主题导入时会自动进行归类到对应的分辨率下，不进行设置可能出现找不到对应分辨率主题的情况

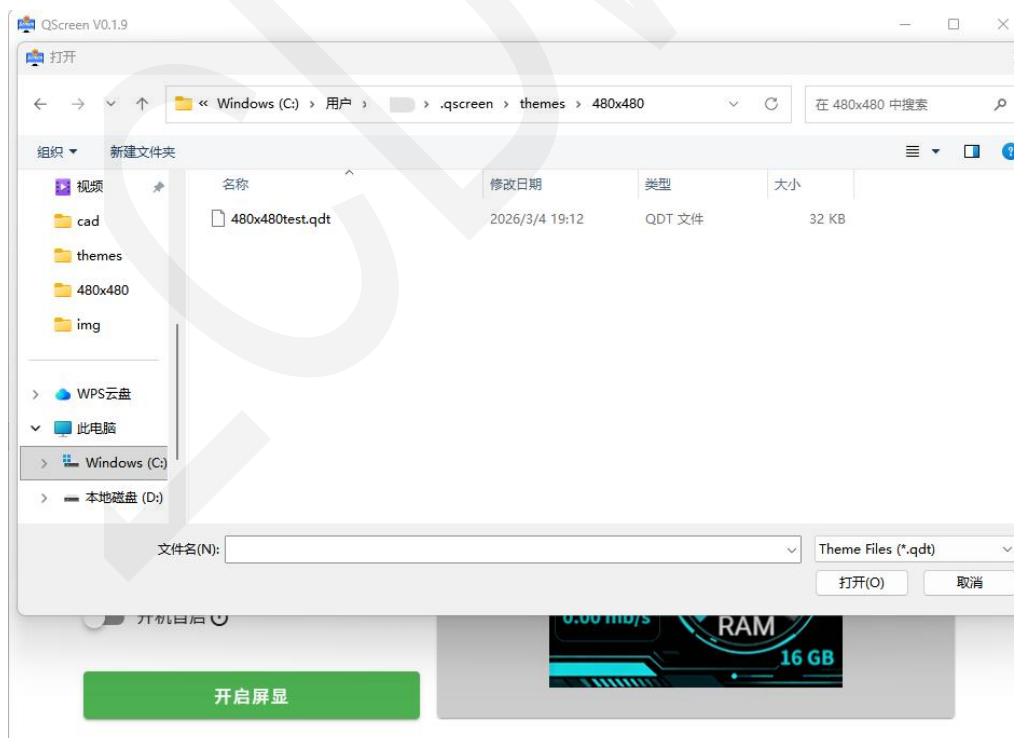

After the production is completed, save it. Please note that the suffix name for saving must be ".qdt". The file name can be customized. It is recommended to save the file in the corresponding resolution folder under the "themes" folder. For example, if I previously set the screen size to 480x480, I will directly save it in the "480x480" folder under the "themes" folder for easier management.

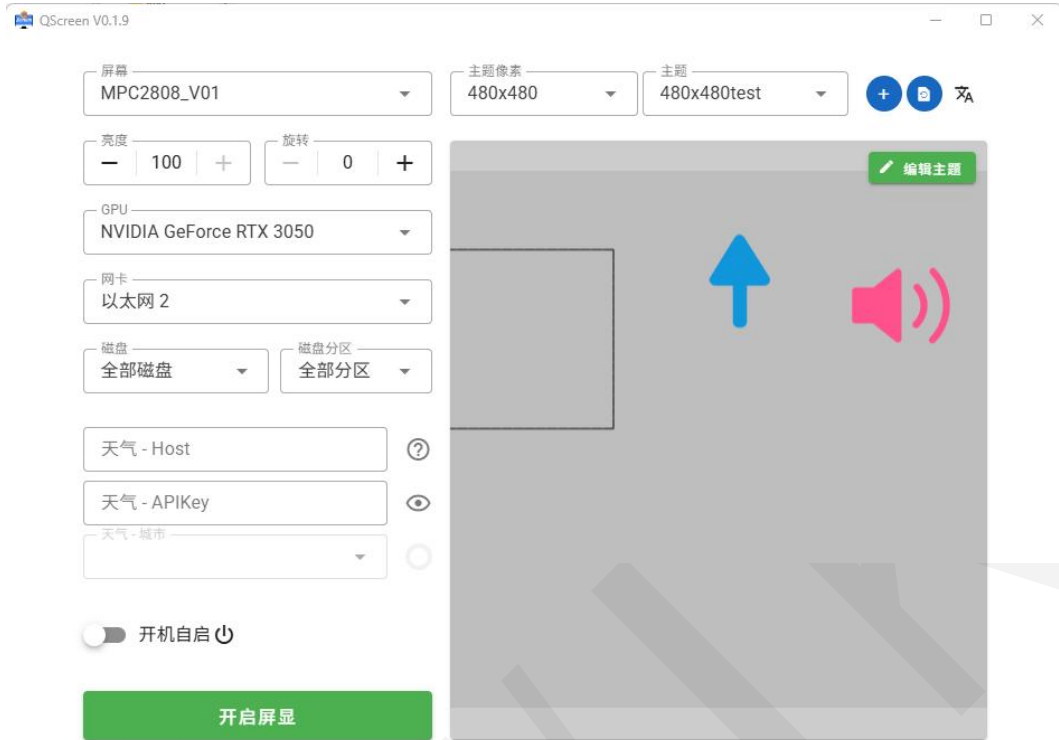

After saving, close the editing page and return to the main page. On the main page, click "Import" and then proceed with the import process.

After saving, close the editing page and return to the main page. On the home page, click "Import" to start the import process. Open the location where the theme was previously saved, select the file and open it. If the file extension was not set as ".qdt" when saving earlier, the file will not be visible.

Now you can see that the newly created file has been automatically loaded at the 480x480 resolution. We select this theme and click on the "Display" button to activate

it.
